

What are StreakStoppers?

What do suntan lotion and Internet firewalls have in common? They're preventative solutions to common nuisances; they exist because it is much easier to prevent a nasty sunburn or a wrecked hard drive than it is to treat it after the fact. Boat owners deal with nuisances all the time, but rarely are there preventative solutions to their problems. Take the black streaks caused by deck water runoff: until recently, a boater's best bet was to clean their hull with a chemical spray solution three or four times a year.

Boat owners no longer need to invest time and money in cleaning black streaks because there is a proven, cost effective way to minimize boat hull maintenance by completely preventing black streaking on the hull. StreakStoppers, made by Ironwood Pacific Outdoors, are the first preventative solution to the black streaking caused by deck water runoff.

StreakStoppers are simple plastic extensions that redirect the deck water away from the side of the hull.

Manufactured from a clear material, they are applied under the boat's rub rail so they are virtually invisible once installed. Simply install StreakStoppers at every drainage point and watch as they channel deck water runoff away from the hull, preventing black streaking.

StreakStoppers are designed to simplify boat hull maintenance and provide years of streak-free boating and are available in packs of 4 and 6 pieces. With a starting price under \$10.00, StreakStoppers cost less than most chemical streak cleaners and eliminate any chemical solution flow into the water after cleaning.

StreakStoppers ensure that boaters will spend more time enjoying the water this summer and less time scrubbing their hulls. Now just don't forget the sunscreen!

StreakStoppers are one of many products in Ironwood Pacific Outdoors' line of premium, problem-solving boating accessories.
